

FMD Rethought. The Result is a Revolution.

Slow scanning drives down productivity

Drug serialisation has a high influence on the process speed in the entire drug chain.

Agonising waiting times instead of speed

Do you know this from scanning? Beep – wait – beep – wait
With large volumes, productivity drops dramatically. And the need for staff increases.

Double labour wrecking your nerves

At long last, you're finished with a box. Instead of 540 packages, only 539 were scanned.
Which one is missing? Now the whole game starts all over again.

There's a much better way! With Lean FMD

Simply scan at lightning speed and in one go. No double recording of packs. No pack is overseen.

Scan faster

With our Speed Scanner, the medicine packs are captured extremely quickly with up to 13,000 scans per hour. Even during the scanning process duplicate scans are detected and all packs are captured without gaps.

Avoid suspicious cases

With Lean FMD, you avoid unnecessary suspicious falsification cases and always react correctly in the remaining cases. Not a single case remains unsolved. If necessary, the medAspis Alert Team provides support.

All data under control

Lean FMD grants you full access to all scanned data - anytime. For reports or your own evaluations. All data are stored for at least five years or longer if required.
Using a modern web service interface, you can access the FMD data structures directly with your ERP.

Simple operation

The mobile FMD Speed Scanner by medAspis is extremely user-friendly. To increase efficiency, simple sound and colour signals support your staff. As soon as critical alerts are detected, the FMD Speed Scanner will stop, and alert management can be started.

medAspis – The FMD Company

We are the European technology leader in the field of FMD/Falsified Medicines Directive. The medAspis team is set up of experts offering long-standing experience in the healthcare, pharmaceutical, IT and logistics industries.

We will be happy to answer any questions you may have:

medAspis Alert Management This Way, Alerts Don't Stand a Chance

How many falsification alerts have you triggered today?

You may not know it, but the authorities certainly do.

The Falsified Medicine Directive (FMD) aims to find and prevent counterfeit medicines. You should be prepared in the best possible way for cases of suspected falsification.

Numerous situations in the daily FMD work processes result in alerts: mistakenly deactivated packs, failed reactivations or delivery of already deactivated goods. Each affected pack has to be separated until the problem is solved. This costs time and the authorities may investigate the case.

The next audit is sure to come

Critical alerts can lead to investigations by competent authorities. Do you have all information to face the questions? Can you provide answers regarding each individual alert?

medAspis Alert Management: Reduce the amount of suspicious cases and be compliant.

1

Prevent alerts

Keep operational speed up and your authority record clean. medAspis avoids most of the alerts even while scanning is in progress – e.g. duplicate deactivations. Alerts will not be sent to the NMVS in the first place.

2

Handle alerts

Not a single case remains unsolved. Alert management includes simple and easy-to-comprehend guidelines for scanning staff and the responsible person. If necessary, the medAspis Alert Team provide support.
